# 1. Introduction

MECS™ (Modular Embedded Computer System) is a modular hardware platform that can be used to build low power computing systems optimised for specific applications.

The modular architecture that is intrinsic to MECS ensures that it is flexible and configurable, making it suitable for use in a wide variety of applications. Maximum product longevity can be reached as the platform is fully upgradeable through the use of a range of Colibri modules and xPOD™ (Expansion Peripheral On-board Device) modules.

This document provides technical details of the MECS Tellurium platform, including interface descriptions, mechanical drawings and connector pin-out information.

The MECS Tellurium carrier board provides regulated power supplies, industry standard interfaces such as USB, Ethernet, Compact Flash and SD (Secure Digital), as well as an on board USB hub, an extremely low power real-time clock (RTC) and xPOD module support.

A range of Colibri modules based on the Intel and Marvell X-Scale microcontrollers provide a variety of processor options, RAM capacities and non-volatile memory storage for operating system, application and user data. The Colibri module can be selected based upon the intended applications requirements, allowing the optimal price versus performance balance to be achieved.

The xPOD interfaces provide a simple method of extending platform functionality to support features such as Wireless LAN (802.11b/g), Bluetooth, CAN (Controller Area Network), GPS, and more.

# 2. Features

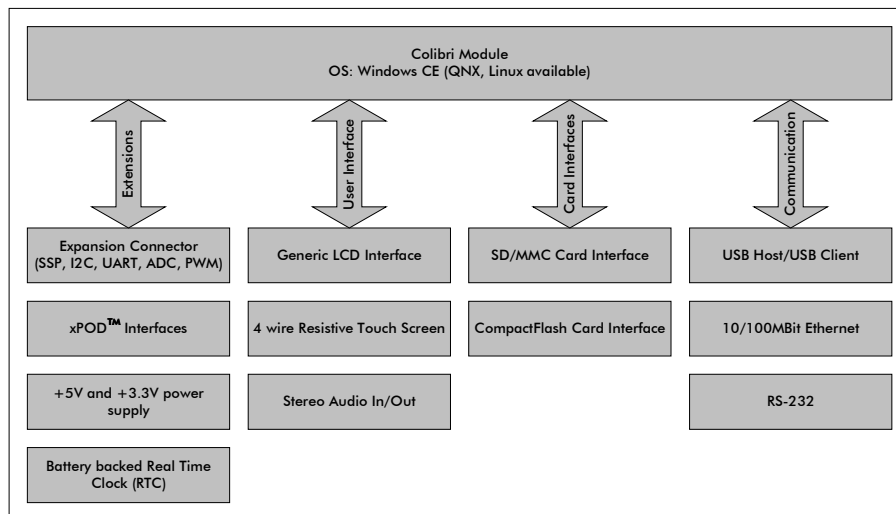

Figure 1: MECS Tellurium Block Diagram

## 2.1. User Interface

- Generic LCD                    40 pin connector interfacing to a wide range of active and passive TFT colour and monochrome LCD panels. Maximum resolution of 1024x768 @ 18 BPP (262,144 colours). Support for serially driven displays via SSP interface.
- Touch Screen                4-wire resistive touch screen connected via 4 pin header<sup>1</sup>
- Audio                            Headphone Out (stereo) and Line In (stereo)<sup>1</sup>
- Keyboard, mouse            Supported via USB interface

## 2.2. Communication Interfaces

Ethernet	10/100Mb
USB	1x USB client (mini-B connector) 4x USB host (2x xPOD reserved, 2x A-type connector)
Asynchronous Serial	1x Full Function RS-232. Maximum 921,600bps

## 2.3. Expansion Interfaces

Expansion Connector	Expansion interface providing the following I/O interfaces: 1x I2C 1x SSP (supporting SPI, MicroWire and custom SPP protocols) 1x BT UART 4x PWM Outputs 4x ADC Inputs <sup>1</sup> Reset In/Reset Out 2x xPOD GPIO Interfaces
xPOD	2x xPOD sockets supporting the following I/O interfaces: 1x I2C 1x SSP 1x USB 1x UART 1x SDIO Reset In/Reset Out 1x xPOD GPIO Interface

## 2.4. Card Interfaces

SD/MMC	1x SD/MMC Card Slot (Push to lock/eject mechanism)
CompactFlash	1x CompactFlash card interface. Large range of memory cards and other CompactFlash compatible expansion peripherals <sup>1</sup>

<sup>1</sup>Interfaces may not be available with certain Colibri modules. Please check compatibility table specified in section 3.

## 3. Technical Specifications

### 3.1. Operating System

Windows CE is the recommended operating system to use with the MECS Tellurium product, and ships pre-installed on any of the Colibri modules. Board support packages are available for custom application development using available Microsoft development tools including eMbedded Visual C++ 4.0 and Visual Studio.

Linux and QNX operating systems are available from third parties.

### 3.2. Processor Options

The MECS Tellurium platform supports a variety of Colibri modules based around the Intel and Marvell X-Scale processor family. Currently supported modules are as follows:

Processor	Marvell PXA320
Clock frequency	806MHz
RAM	128MB DDR RAM (32 bit)
FLASH	1GB FLASH (8 bit)
Processor	Intel PXA270
Clock frequency	312MHz
RAM	64MB SDRAM (32 bit)
FLASH	32MB FLASH (32 bit)
Processor	Intel PXA270
Clock frequency	520MHz
RAM	64MB SDRAM (32 bit)
FLASH	32MB FLASH (32 bit)
Processor	Marvell PXA300
Clock frequency	208MHz
RAM	64MB DDR RAM (32 bit)
FLASH	128MB FLASH (8 bit)

Table 1: Supported Colibri Modules

Function	PXA270	PXA300	PXA320
Audio	•		•
CompactFlash	•		•
Ethernet	•	•	•
Expansion Interface	•	1	•
External Power Supply	•	•	•
Generic LCD interface	•	•	•
RS-232	•	•	•
SD/MMC Card	•	•	•
Touch Screen	•		•
USB Host	•	•	•
USB Client	•	•	•
xPOD 1	•	•	•
xPOD 2	•	•	•

Table 2: Compatibility Table

<sup>1</sup> Reduced interface supported. Please see section 6.

### 3.3. xPOD Interface

The xPOD™ standard provides a mechanism for easily expanding system functionality through additional plug-in hardware modules. The xPOD standard defines an electrical interface specification and a mechanical form factor, ensuring hardware compatibility between the Tellurium platform and future additions to the xPOD module family.

The xPOD electrical interface provides a wide range of serial communication interfaces, GPIO interfaces and regulated power supplies as follows:

- SSP (Synchronous Serial Protocol)<sup>1</sup>
- UART (Universal Asynchronous Receive Transmit) [software handshaking only]
- I2C (Inter-Integrated Circuit)
- Full speed USB 2.0
- SDIO (Secure Digital I/O)<sup>2</sup>
- Reset In/Reset Out
- 2x Host GPIO (connected to GPIO signals on the Colibri SODIMM connector)
- +5V and +3.3V regulated power supplies
- 8x xPOD GPIO (connected directly to the expansion connector so that the platform can communicate with any external devices through a single interface)

Not all interfaces will be used by every xPOD module: each xPOD module can make use of the interfaces that it needs to achieve the functionality specific to that xPOD.

There are 2 xPOD interfaces available on the Tellurium platform.

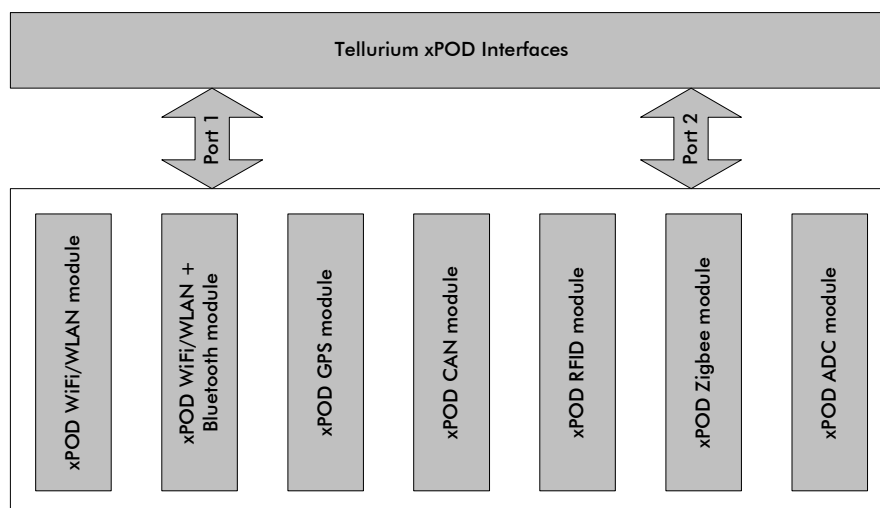

Figure 2: xPOD interfaces and example xPOD plug-in modules

Each xPOD interface supports a single xPOD module. An example of current and future xPOD modules are shown in figure 2. New xPOD devices are being constantly added to support additional functionality, so please check with your local distributor for xPOD availability.

<sup>1</sup> The SPP interface is shared between the xPOD 1 interface and the 40 way expansion interface on the MECS Tellurium platform.

<sup>2</sup> The SDIO interface is multiplexed between both xPOD 1 and xPOD 2 interfaces and the SD/MMC card slot on the MECS Tellurium platform.

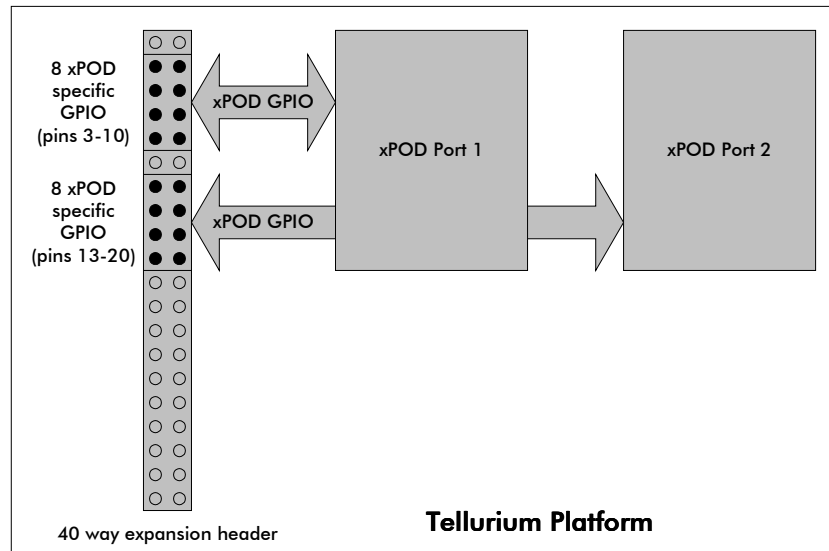

Figure 3: xPOD GPIO interfaces between xPOD ports and the 40-way expansion connector

Figure 3 shows how the xPOD GPIO interface is mapped to individual pins on the 40-way expansion connector. The functionality of these pins will depend upon the type of xPOD module installed.

For instance, with the 4 channel 10 bit ADC xPOD installed, 4 of the xPOD GPIO pins become ADC input pins and 4 become analogue ground pins. This enables the Tellurium platform to provide a single, robust expansion interface for external connectivity, whose functionality can be tailored to individual applications requirements by selecting the required xPOD hardware modules.

### 3.4. Power Supply

The power supply on MECS is a buck type switched mode high-efficiency supply providing both +3.3V and +5V regulated supplies.

It is capable of supplying up to 3A @ +3.3V (9.9W) and 3A @ +5V (15W). The power supply has a built in thermal shutdown mechanism which will place the supply into thermal shutdown should an over-temperature condition occur to prevent damage.

Input voltage: 7-48V DC supported (absolute maximum of 75V).

Power availability: Up to 3A @ 3.3V and 3A @ 5V

Reverse polarity protection is included.

### 3.5. Detailed Interface Description

#### CompactFlash interface

Interface supports both Type I and Type II cards. Available for non-volatile FLASH memory expansion and peripheral expansion (e.g. WiFi, Bluetooth, GPS, RFID, etc).

## SD card interface

SD card interface supports 4 bit, 1 bit and SPI interface mode. The bus is multiplexed with the xPOD interfaces on the Tellurium platform. In order to use the SD interface, one of the three possible device interfaces must be selected (i.e. SD card slot, xPOD port 1 or xPOD port 2). Figure 4 shows a schematic representation of how the SD interface is multiplexed between the three device interfaces.

Figure 4: Multiplexed SD clock signal

By default, the SD card slot is selected. Care should be taken when using an xPOD module which makes use of the SD card interface if it is also intended to make use of the SD card slot. Coexistence software may be required to support multiple SD devices at the same time, and the user should be aware that restrictions may apply to the use of the SD interface when sharing it between multiple devices.

B	A	Selected interface
L	L	SD card slot
L	H	xPOD Port 2
H	L	xPOD Port 1

Table 3: Multiplexer truth table

Table 3 shows the multiplexer truth table.

## USB host/client

An on-board USB 2.0 compliant hub controller allows up to two USB host devices to be connected via the available type A USB connector ports at any one time. A further two USB 2.0 compliant ports are available through the two xPOD interface connectors for use by installed xPOD modules.

## Ethernet

10/100Mb Ethernet is available via the on-board RJ-45 connector. X9 must be set according to the following table depending upon the installed Colibri module:

Colibri Module	X9 Setting
PXA270	1 - 2
PXA300	2 - 3
PXA320	2 - 3

Table 4: Ethernet jumper setting

## RS-232 Serial

An RS-232 compliant serial port is available via the 10 way 2.54mm pitch on-board male header

## SSP

Synchronous Serial Ports (SSP) are available<sup>1</sup> via the 40 way male expansion header and on the xPOD interfaces. 2 independent SSPs are available; one accessible via an xPOD interface connector and the second shared between the 40 way expansion connector and the xPOD 2 interface connector. SPI™ (Serial Peripheral Interface), MicroWire™ and custom SSP protocols are supported.

## UART serial

A Bluetooth Asynchronous Serial Port is available via the on-board 40 way expansion header and xPOD port 1 (only the Rx and Tx signals are supported on the xPOD interface – i.e. no hardware flow control). A standard (no hardware flow control) UART serial port is available on xPOD port 2.

## I2C

The Phillips Inter-Integrated Circuit (I-Squared-C) bus is available via the 40 way expansion header and both xPOD interfaces. This bus is used to configure the on-board USB hub controller and for xPOD module detection and configuration. The on-board RTC is also interfaced via the I2C bus.

## ADC inputs

4x 10 bit Analogue-to-Digital Converter inputs are available via the 40 way expansion connector, depending upon the installed Colibri module (please see section 6 for more information). These inputs are filtered using an RC network prior to reaching the converter input pins. The time-constant for each RC network is ~100ms.

## PWM outputs

4x Pulse Width Modulated outputs are provided via the expansion interface.

## GPIO

Certain pins on the expansion interface can have their pins configured for GPIO (General Purpose Input/Output) use. Please see the relevant Colibri module datasheet for alternative pin function.

## **3.6. Display interface**

The Tellurium platform provides a generic digital display interface capable of driving almost any active or passive TFT panel with up a resolution of up to 1024x768 @ 18 bpp (262,144 colours). This interface also provides a PWM channel for back light brightness control and an SSP interface for displays that require power up configuration. Both regulated 3.3V and 5V supplies are available on this interface.

A large range of display interface connectors are available for the MECS Tellurium platform allowing fast and easy integration with a variety of industry standard displays, from highly transmissive CCFL to widescreen LED backlit. The range of displays supported by off the shelf connectors is being constantly expanded – please contact your local distributor for a comprehensive list.

<sup>1</sup> Please see section 5.6 for more detailed information.

### 3.7. Real-Time Clock

An on-board real-time clock (RTC) based around the STMicroelectronics M41T81S ensures that accurate time can be kept in the event of a power failure or when the system is legitimately powered down. The RTC provides counters for tenths/hundredths of seconds, seconds, minutes, hours, day, date, month year and century.

An ultra low battery supply current of 0.6µA ensures extremely long backup battery lifetime, which is further enhanced by the devices ability to automatically switch between battery supply and primary 3.3V power supply when the latter is available.

In the event of an unexpected power failure, the RTC can provide a timestamp indicating what time the power failure occurred.

### 3.8. Status LEDs

There are four individual LEDs on the Tellurium.

Two are located in the area which contains the on-board 3.3V and 5V power supplies. When lit, these indicate that the associated supply is powered (the silkscreen text adjacent to each LED indicates which LED is associated with which supply).

There is an orange LED which is located adjacent to the USB hub IC (device marked NXP ISP1520). When the USB hub is operational (hence a host link with the Colibri USB port is present) this LED will pulse at a rate of approximately 1Hz. During normal operation, this LED should be pulsing. Any other state indicates the hub is not functioning correctly.

The fourth LED is a green LED located in the vicinity of the USB client port (mini-B connector). This LED will light to indicate when a connected USB host device is providing power to the port.

## 5. MECS Tellurium Connectors

---

### 5.1. Connectors

The following is the complete list of connectors supported:

Connector	Description
X1	RS-232
X2	USB Client
X3	CompactFlash card slot
X4	Touch screen
X5	Display
X6	Ethernet
X7	CPU Module
X8	Generic I/O Expansion
X9	Ethernet Select
X10	External Power Supply
X11	Audio
X12	SDIO card slot
X13	USB Host
X14	xPOD 1
X15	xPOD 2

Table 5: Connector description

This section provides detailed information on the signal pin-out of each connector, where necessary.

37	8	RAW_AD0	•		•	Analogue-to-Digital Converter input 0	RC filter, T ~ 100ms
38	6	RAW_AD1	•	<sup>1</sup>	•	Analogue-to-Digital Converter input 1	RC filter, T ~ 100ms
39	26	nRESET_IN	•	•	•	Reset in (pull low to reset)	10nF capacitor to ground
40	87	nRESET_OUT	•	•	•	Reset out (pulled low during Colibri reset)	

Table 7: Generic expansion connector

The XPOD GPIO signals that are available on the expansion connector allow direct connection to the XPOD interfaces. Their function is dependent upon the installed XPOD module(s). Custom XPOD modules can make use of these interface connections.

<sup>1</sup> These pins are only available as GPIO.

## 5.6. xPOD

Connector manufacturer:	Hirose
Number of ways:	40
Pin pitch:	0.5mm
Maximum voltage:	50VAC
Maximum current:	0.3A
Connector part number:	DF17
Connector partner part number:	DF17

### 5.6.1 xPOD 1 interface

Pin	SODIMM Pin	Default Function	PXA270	PXA300	PXA320	Description	Pull-up/Pull-down/Filtering/ESD/EMI
1	-	5V				+5V power supply	220R/100MHz/2A ferrite bead
2	-	3V3				+3.3V power supply	220R/100MHz/2A ferrite bead

35	-	XPOD2_GPIO6	•	•	•	XPOD GPIO 6 (direct connection to XPOD 2 interface)	
36	-	XPOD2_GPIO7	•	•	•	XPOD GPIO 7 (direct connection to XPOD 2 interface)	
37	26	nRESET_IN	•	•	•	Reset in (pull low to reset)	10nF capacitor to ground
38	-	GND				Ground	
39	-	GND				Ground	
40	-	GND				Ground	

Table 9: xPOD 2 interface connector

<sup>1</sup> These pins are SDIO multiplexed pins.

<sup>2</sup> These pins are served by the on-board USB hub and OC protected power supply ICs.

<sup>3</sup> This interface is not supported in hardware for the PXA3xx and must be emulated in software; this may not be suitable for certain xPODs which require a high speed SSP interface.

## 5.7. External Power Supply

Connector manufacturer: Harwin  
 Number of ways: 8  
 Pin pitch: 1.25mm  
 Maximum voltage: 150VAC  
 Maximum current: 1A  
 Connector part number: M30-6000846  
 Connector partner part number:

Pin	Default Function	Description	Pull-up/Pull-down/Filtering/ESD/EMI
1	3V3	+3.3V power supply	220R/100MHz/2A ferrite bead
2	3V3	+3.3V power supply	220R/100MHz/2A ferrite bead
3	GND	Ground	
4	GND	Ground	
5	5V	+5V power supply	220R/100MHz/2A ferrite bead
6	5V	+5V power supply	220R/100MHz/2A ferrite bead
7	BL_ON	Back light on (+3.3V level signal)	
8	nBN_ON_5V	Back light on (inverted, +5V level signal)	

Table 10: External power supply connector

## 5.8. Audio

Connector manufacturer: Harwin  
 Number of ways: 8  
 Pin pitch: 1.25mm  
 Maximum voltage: 150VAC  
 Maximum current: 1A  
 Connector part number: M30-6000846  
 Connector partner part number:

Pin	SODIMM Pin	Default Function	PXA270	PXA300	PXA320	Description	Pull-up/Pull-down/Filtering/ESD/EMI
1	5	LINEIN_L	•		•	Audio line in left	
2	7	LINEIN_R	•		•	Audio line in right	
3	9, 11	AUDIO_AGND	•		•	Audio ground	
4	15	HEADPHONE_LF	•		•	Headphone left	
5	17	HEADPHONE_RF	•		•	Headphone right	
6	9, 11	AUDIO_AGND	•		•	Audio ground	
7	-	N/C				Not connected	
8	-	N/C				Not connected	

Table 11: Audio interface connector

## 5.9. RS-232

Connector manufacturer:	TBD
Number of ways:	10
Pin pitch:	1.27mm
Maximum voltage:	TBD
Maximum current:	TBD
Connector part number:	TBD
Connector partner part number:	TBD

Pin	SODIMM Pin	Default Function	PXA270	PXA300	PXA320	Description	Pull-up/Pull-down/Filtering/ESD/EMI
1	31 <sup>1</sup>	FF_DCD_232	•	•	•	Full function UART Carrier Detect	
2	37 <sup>1</sup>	FF_RI_232	•	•	•	Full function UART Ring Indicator	
3	29 <sup>1</sup>	FF_DSR_232	•	•	•	Full function UART Data Set Ready	
4	27 <sup>1</sup>	FF_RTS_232	•	•	•	Full function UART Request To Send	
5	33 <sup>1</sup>	FF_RXD_232	•	•	•	Full function UART Receive Data	
6	35 <sup>1</sup>	FF_TXD_232	•	•	•	Full function UART Transmit Data	
7	25 <sup>1</sup>	FF_CTS_232	•	•	•	Full function UART Clear To Send	
8	23 <sup>1</sup>	FF_DTR_232	•	•	•	Full function UART Data Terminal Ready	
9	-	GND				Ground	
10	-	GND				Ground	

Table 12: RS-232 interface connector

## 5.10. DC power jack

DC power jack is centre positive. Centre pin diameter is 2.5mm.
